

TOOL FOR CONFIGURING AVAILABLE FUNCTIONS OF AN APPLICATION

ABSTRACT OF THE DISCLOSURE

Methods, systems and articles of manufacture for controlling accessibility to application functions and for configuring user interfaces to restrict access to available application functions. In one embodiment, a request is received for a web page comprising displayable content including user-selectable elements through which a user invokes one or more executable functions. The web page is provided the displayable content and then parsed to identify the user-selectable elements. At least portion of the user-selectable elements are disabled on the basis of a pre-defined transform definition to produce a re-configured web page. The re-configured web page is then returned for display.
